

suggesting a link between aerosol operations and changes in human biology.

Morgellons syndrome (as anything but a mental disorder) is dismissed by authorities. It is minimized by many doctors and scientists, despite a rise in skin ailments often diagnosed as "folliculitis." Although celebrities have been affected, TV specials aired and a few official "studies" undertaken, there is no honest official discussion about the true nature of Morgellons and its ramifications.

The official blackout on chemtrails, environmental tests and Morgellons

Although concerned citizens have presented laboratory results of environmental testing to official agencies nationwide (findings that show high spiking of heavy metals in soil and water), they are continually told not to worry. Concerned citizens who have contacted airports and other official agencies to report aerosols obscuring the sky are also told not to worry and that these are just "normal jet contrails." *Discussing these phenomena with the public is clearly off limits.* The moratorium appears to exist even on the local level – in small towns and rural counties with low population. *The question is, WHY?*

It could be theorized that a hidden plan to alter living things of many kinds is underway. The science of genetic modification (GMOs) is experimenting with new varieties of plants that resist a range of environmental conditions, including high soil levels of aluminum. (Why are scientists doing this instead of asking why so much aluminum is in the soil to begin with?) The futurist Ray Kurzweil, a leading advocate of *transhumanism*, said: "We are going to put these

technologies inside us. We are going to become a hybrid of machine and our biological heritage. We are not going to be transcending our humanity. We are going to be transcending our biology."

Transhumanism (the new word for *eugenics*) is a movement that favors the improvement and enhancement of human beings, a stated goal being "the marriage of man with machine." Transhumanists envision a day when humans will be gender-neutral (neither male nor female). Reproduction will be in a laboratory, not in the body itself. Scientific selection and control will one day enable us to overcome the limitations on lifespan, health, sex, and intellect imposed by nature. We will be transformed from *Homo sapiens* into *Homo evolutis*.

One Morgellons researcher recently found that critical parameters separating the biological life kingdoms have been "crossed" in human tissues. In other words, cells in the human body now possess attributes that are entirely new and not germane to the biological group we belong to (*eukaryotes*). How did this happen, and *is it possible that our biology is already being engineered?*

If so, one would have to conclude that somehow something is getting into us that is changing our cells, which must mean that it is also changing us. People today are very different from their ancestors. We relate to technology much more readily than we relate to nature, and we are heavily dependent on societal organization (the "hive") to meet our basic needs. In other words, we are already products of industrialized culture and may well be entering a transhuman corridor. *Question:* Should we believe our present life and culture has simply "evolved," or should we wonder whether a calculated social, political and biological engineering has been and is going on?

The story behind Chemtrails is a big one

If it could be said that a program to spray the sky is underway all over the world to modify extremes of weather ... If it could be said that artificial clouds are being made to cool the earth by dimming the sun ... If it could be said that mankind has arrived at changing nature to suit human needs ... *All this would mean that the course of "global warming" and "climate change" could be altered by modern technology.*

Most people laugh if you propose the idea that man can create the weather. The fact is that weather manipulation/modification technologies have been available for decades. An early example was Project Popeye in Vietnam, a rainmaking program that turned the Vietnamese roads into rivers of mud. That was back in the 1960s. Much progress has been made since then. In fact, a research document prepared for the U.S. Air Force in 1996 was titled "*Weather as a Force Multiplier: Owning the Weather in 2025.*"

For decades, people all over the world have seen lines in the sky left in the wake of jet planes. Called *contrails*, they are created by engine exhaust at high altitudes where the air is dry and cold. Contrails (from the *condensation* of water vapor) dissipate quickly, just as your breath does on a winter day.

Today, we are witnessing trails left by aircraft that do *not* dissipate, but instead linger for hours and spread out to form cloudlike masses and layers of haze. These trails often precede overcast skies or rain. A day that begins sunny and blue can end up cloudy as planes cross above, leaving lines that fan out and change shape. *You can look up and watch this.*

NASA admits man-made clouds

NASA and other official agencies have announced that today's atmospheric conditions are causing "persistent jet contrails" resulting in "man-made clouds." In fact, we're told that this phenomenon has resulted in a loss of sunlight referred to as *global dimming*, and should be exploited to cool the earth so as to reduce the effects of global warming. Schoolchildren are being taught to spot "cool new cloud" forms. But no one explains *why* these new clouds are forming. *What has happened in the atmosphere since the invention of jet engines that is causing man-made clouds?*

The answer is *nothing natural*. Rather, the science of weather engineering has been operating covertly and is now plainly showing its effects. Worldwide experiments with electromagnetism are already affecting and creating our weather, and the results are being explained to us as "climate change." The HAARP facility in Alaska emits electromagnetic frequencies for "research purposes" (that's all we're told). Government scientists are now proposing *geoengineering* programs to tackle climate change, which include spraying aerosol particulates to block sunlight and create artificial clouds. This is an example of *artificially causing a problem* (extremes of weather called "climate change") and then *offering a solution* (geoengineering). As so-called "climate change" continues, people will be made to see the wisdom and necessity of planetary engineering.

What's in chemtrails?

The persistent contrails that form haze and clouds are popularly referred to as *chemtrails*. They appear to be

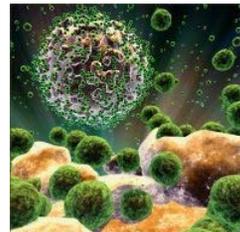

made of sprayed aerosol materials, just as today's geoscientists are proposing. It seems that a global aerosols program (with the cover story of "persistent contrails") is already in place. *What exactly are the planes spraying?* people want to know. Environmental testing by concerned citizens nationwide shows dangerous levels of barium, aluminum and other heavy metals in soil and water samples. Airborne fallout after aerosol spraying reveals three types of content: fibers, biological elements and metal particulates. The presence of these materials in our atmosphere has diminished visibility, whitened the sky, and may well be causing health problems. The metals are ionized, and have made the air we live in a *plasma* (conductive gas).

All around us, trees, plants and animal species are dying. This is conveniently being blamed on pollution, environmental toxins, pests, blight, and corporate greed. In the meantime, GMO science is developing seeds that tolerate aluminum, resist insects and are patented. Could it be that as the natural world expires, man-made replacements will be ready to step in? *Control of weather is one agenda; control of nature may be another.*

Synthetic Biology

The field of *synthetic biology* is being hailed as the most exciting frontier of science. It draws on many different areas, including biochemistry, bio-medicine, genetics, robotics and information technologies. Its goal is to improve on and transcend the limits of nature. Where "helping humanity" is concerned (as in engineering tissues to repair damage), science is indeed

progressing toward wonders. *But that may be the friendly tip of a sinister iceberg.* What if a plan is in the works to control everything – humans, nature, the environment? How would it be implemented, as most of the world's population would likely not consent?

Nanotechnology is defined as the manipulation of particles less than one micron in size (a micron is one millionth of a meter). Biology itself works on the nano scale as submicroscopic materials assemble to orchestrate all kinds of life processes. Advances in microbiology and other technologies are enabling us to understand and even to control sub-cellular biology, paving the way to what is known as *artificial or synthetic biology*.

Morgellons Syndrome

For several years, certain people have been plagued with a skin condition known as "Morgellons," which manifests in sores or lesions that often produce fibers and other materials of a technological nature. Laboratory analysis of the fibers cannot identify them, meaning they are of *unknown origin*. Other artifacts issuing from the lesions are crystalline, polygonal and/or quartz-like, resembling a variety of minuscule forms and devices used in nanotechnology.

Ordinary citizens who have procured microscopes and examined these materials are concerned that covert technologies have already entered human bodies and are at work inside us in unknown ways. Some self-educated researchers have found critical transformations of cell forms in a wide range of human subjects, suggesting that even those who do not suffer from Morgellons are experiencing microscopic bodily intrusions. The elements found in human tissues can be matched with what has been found in environmental fallout (airborne samples),
